

	Excellent (2.5 marks)	Good (1.5 marks)	Insufficient (0 marks)
Research Aims	Well beyond basic balanced-class supervised learning methods with novelty method/analysis proposed.	Beyond basic balanced-class supervised learning methods though without much novel analysis of methods proposed.	Basic supervised learning experiment with close to balanced classes. No novelty in either analysis or propose method.
Dataset	Dataset(s) that presents at least two of the following challenges outlined by student: - Data is structured sequentially/ temporally (time series) - Data contains spatial information. - No labelled data classes. - A very significant level of imbalance between classes, - Requires datasets from multiple sources to be linked/combined. - Data is weakly labelled (i.e. noise, missing values, only contextual labels, mixture of labelled and unlabelled data). - Has limited to no previous experiments published this data (using your proposed method). - Very large dataset (i.e. requires innovative techniques in order to obtain subset/sample) - Very small data (i.e. requires innovative techniques in order to build a meaningful model) - Requires real-time processing. - Have limited to no published data regarding bias/ethical concerns. Single dataset with no significant challenges.
GDPR	All copyright and licence information provided. States whether there is a legal basis for using data.	All copyright and licence information provided. States whether there is a legal basis for using data with perhaps some oversights.	Little to no information about licence or legal basis for use of data.
Ethical Considerations	Well reasoned and multi-faceted discussion of ethical considerations for use of dataset for proposed analysis.	Well reasoned discussion of ethical considerations for use of dataset for proposed analysis.	Little to no information on ethical considerations.
